## Case Study: Probabilities & Decision Trees

## Important

Please note that you can download PDF and Microsoft Word versions of this case study using the links on the right.

## Case 1

In a hypothetical community, 60% of all people consume at least 6 alcoholic beverages per week and 50% are overweight. The percentage of people who are both overweight and consume this much alcohol is 40%. Construct a 2x2 table to answer (a)-(c) below. For part (d), construct a decision tree.

• What percentage of people consume at least 6 alcoholic beverages per week, are overweight, or fall into both categories?

• You sample at random a person from the community and find that they consume at least 6 alcoholic beverages per week. What is the probability that they are overweight?

• What is the probability that someone from this community consumes at least 6 alcoholic beverages per week if they are overweight?
• Draw a decision tree to represent this problem
Case 2
A new screening procedure can detect $80\%$ of women diagnosed with breast cancer but will falsely identify $2\%$ without breast cancer. The prevalence of breast cancer in the population is $1.6$ in $100$
• What is the probability that a woman does not have breast cancer if the test is negative?
• What is the probability that a woman has breast cancer if the test is positive?
